

The visualization process

Data transformation

- create structural model mapping raw data into data table

Visual mapping

- Create visual structural models into visual structures

View transformation

- Create views of the visual structures, ~~eg~~ by specifying graphical parameters such as position, scaling and clipping

Seven stages: Aquire

- obtain the data

Data Transformation

Parse

- Provide some structure for the data's meaning, and order it into categories.

Filter

- Remove all but the data of interest

Mine

- Apply methods, statistics or data mining as a way to discern patterns or place the data in mathematical contexts.

Dataset → Visual form
↓

Visual mapping

- Choose a visual mode such as a graph, list or tree
