

- ~~filter()~~
- `filter()` Select a subset of rows by condition
- `arrange()` reorders rows in df
- `select()` Select the columns of interest
- `mutate()` Create new columns based on existing columns
- `summarize()` Aggregate values for each group, reduces to single value.

- `filter(data, condition)`
- Returns a subset of the rows
 - multiple conditions can be supplied
 - They are combined with an AND

~~movies_df %>% filter(year > 2000)~~
~~filter(year > 2000, genre == 'comedy')~~
%>%

comedies <

movies_df %>%

filter(year > 2000,

comedy = 1 ~~genre == 'comedy'~~
budget > 10000000)

%>%

arrange(desc(rating))

%>%

select(title, rating)

`mutate(data, new_col =
function(old_cols)`

$\text{Cost_per_min} = \text{budget} / \text{length}$

`group_by()`

`by_ratings <- group_by(movie_dt, ratings)`

`group 1:`

~~movies~~ rows of movies with
same rating

`group 2:`

rows of movies with
same ratings

`summarize()`

↓
count count of rows
